

PROGRESS & INVESTMENT UPDATE

A commission-free ordering platform for Dough Boss — built, tested, and almost ready to switch on.

Prepared by Elie D. for the Dough Boss ownership team · 1 July 2026

1 AT A GLANCE

Where things stand, in four numbers

9 modules

built in the live plugin —
some still switched off

\$600

AI development
investment to date, per
internal tracking

v2.12.1

current build, already
through 16 hardening
passes

1 shop

configured today — a
second shop needs setup
before it can go live

- **9 core modules built** — ordering, payments, kitchen board, vouchers, catering, staff app, notifications and more; card payments, notifications and true multi-shop use are built but not yet switched on.
- **\$600 AUD** — total AI development investment to date per internal tracking, covering the entire build end-to-end.
- **v2.12.1** — the current release, hardened across 16 dedicated security/accessibility passes.
- **1 shop** — the plugin currently has one shop configured (named after the site); additional shops such as a Revesby location can be added via the admin Shops screen when ready.

2 EXECUTIVE SUMMARY

The DoughBoss platform is built and running. What started as a commission-free ordering system for Dough Boss has grown into a genuinely full-featured operation: a branded storefront with a custom pizza builder, GST-correct pricing computed safely on the server, a real-time kitchen order board, a working voucher/discount engine, and the groundwork for card payments, catering enquiries, and a dedicated staff app — all already in the codebase, not on a whiteboard.

The build has been through sixteen separate hardening passes covering security, accessibility, and everyday usability — this isn't a first draft, it's a system that's been stress-tested against its own edge cases repeatedly. Per internal tracking, the entire effort to date has cost **\$600 AUD** in AI-assisted development, covering both the backend plugin and the customer-facing storefront as one continuous build.

What's left is not a long list of engineering unknowns — it's a short, specific list of business decisions and a handful of details only Dough Boss can provide (menu, shop details, ABN, and a couple of POSPal back-office settings). Once those land, along with confirming which switched-off features to enable for day one, the plugin is in a position to soft-launch at a single configured shop.

3 WHAT'S BEEN BUILT

Module	What it does
Storefront & pizza builder	Branded menu with a custom pizza builder customers can order from directly on the website.
Cart & checkout	Guest-friendly cart with pickup/delivery, correct AUD pricing with GST built in — always calculated on the server, so totals can't be tampered with in the browser.
Card payments (Stripe)	Built and tested end-to-end, currently switched off — ready to turn on the moment we have live keys and the green light.
Live kitchen order board	A real-time screen for the kitchen showing incoming orders instantly, with an automatic fallback check every few seconds so nothing is ever missed even if the connection drops.
Vouchers & discounts	Typo-resistant discount codes with QR scanning, each one usable exactly once — including the \$5/\$10 student voucher program with a shared daily cap.
Staff Console app	A simple, install-on-any-device app for staff to scan vouchers, manage them, and watch the order board — no need to log into full WordPress admin.
Catering enquiries	A complete enquiry-to-deposit pipeline: customers submit a request, the system quotes it, and tracks it through deposit, balance and fulfilment.
Multi-shop routing	The platform supports multiple shops out of the box; one shop is configured today, with each additional shop set up individually in the admin as it comes on line.
Notifications & alerts	SMS to customers when an order's ready, push alerts to kitchen phones, and cloud receipt printing — all built and working, switched off until the notification accounts are connected.

4 INVESTMENT TO DATE & VALUE

Per internal tracking, **\$600 AUD** has funded the entire build to date — the storefront, the pizza builder, checkout and payments groundwork, the live kitchen board, vouchers, catering pipeline, and the staff app — all as one continuous AI-assisted development effort, with no separate backend/frontend billing to reconcile. This figure comes from our own internal record-keeping rather than an audited invoice trail.

Running the site day-to-day is inexpensive: domain, hosting and database costs are recurring items in the tens-of-dollars-a-month range, and we'll confirm the exact figures from account records rather than estimate them here — no invoices or receipts for these have been logged to date. As an honest planning number, an independent 2026 costing review of a comparable build puts ongoing running costs at roughly **\$95–\$180 per month** once live — a useful ceiling to budget against.

To put the \$600 in context, the table below shows what a comparable build typically costs when commissioned from an Australian agency, per an independent market-rate costing review dated 25 June 2026:

Scope	Typical agency cost (AUD, ex-GST)
The ordering plugin alone	~\$128,000 (range \$95,000–\$165,000)
Whole system — plugin, website, branding, integrations, content, PM	~\$180,000 (range \$135,000–\$235,000)

5 WHAT'S LEFT TO GO LIVE

One blocking business item — the last link in the voucher loop

Vouchers can already be issued, scanned and marked redeemed in DoughBoss, and the code that grants and revokes a till discount on claim/redeem is already fully built and connected end-to-end. The only remaining step is Dough Boss creating the \$5 and \$10 discount *rules* inside the POSPal back office and giving us the resulting rule IDs to enter into settings. **This is a setup task on your side, not a coding task on ours** — once those two rule IDs are entered, the loop is live. (POSPal access is currently provisioned for one shop only; additional shops need their own POSPal account connected first.)

Business inputs we need from you

- The real, final menu — item names, photos, AUD prices, pizza sizes and toppings, any combos.
- Each shop's address, trading hours, pickup/delivery details and your ABN (for tax invoices).
- Confirm the final brand name for launch materials — Dough Boss, with "Bite Pizzas" as a project working name, or something else — so we lock it in before anything goes to print.

Hardware & hosting readiness

- A kitchen tablet or screen with reliable wifi at each shop going live.
- WordPress/hosting login access, a fresh backup taken, and ideally moving off any free/basic hosting tier before launch.

Switch-on decisions already built and waiting

- **Card payments (Stripe)** built · off — needs live keys and a go-ahead.
- **Multi-shop routing** built · one shop configured — additional shops (e.g. a Revesby location) can be added in the admin as they're ready to go live.

6 RECOMMENDED NEXT STEP

Path to a first soft-launch:

1. **Lock the menu and shop details** — send through final items, prices and the operating details for the first shop going live so we can load the real menu and configure that shop in the admin.
2. **Set the two POSPal discount rules** for that shop and hand us the rule IDs — this closes the voucher-to-till loop.
3. **Decide on Stripe** — tell us whether to switch it on for day one; it can also follow later with zero rebuild.
4. **Soft-launch the first shop** — run it live at one shop first, confirm it end-to-end with real orders, then configure and roll out to additional shops with confidence.

The platform is built, hardened, and waiting. What's left is a short list of decisions only Dough Boss can make — once those are in, we're days, not months, from live orders.
